

Homework

Si je pouvais changer tout ce que je voulais sur le web :

- J'interdirai toutes les boites mails qui ne signent pas leur mails ou qui ne vérifient pas les signatures
- taille des pages outrageusement trop grosses -> standardiser les pages en version light
- obligation d'utiliser du json à la place du xml
- interdire tous les sites qui font des animations en javascript quand il existe un équivalent full css
- j'aurai monté un groupe de développeur dont la mission aurait été de développer un transcompiler flashplayer -> javascript/canvas pour continuer de jouer aux jeux sur jeu.fr

If I could change what I want on the web I would first avoid all mail box that aren't signing emails or not verifying email's signatures. That's probably the older and huger security problem of the world and I don't understand why people still use email to send precious information. Then I would instore a standard light version on all website because developpers and mostfully wordpress-site-creator think everyone has a super powerfull mobile phone or a gaming computer and that's why you wait 10 seconds to read an acticle on le monde on your old smartphone. Finally I would avoid the use of XML as a data transfert format because that's the worst thing to read ever. JSON would be the official standard.
